

FOOT NOTES

From the office of Carlisle Foot & Ankle

New Treatment Offered for Peripheral Neuropathy

We are excited and pleased to announce the addition of **NeurogenX** therapy as a conservative treatment modality for patients with painful peripheral neuropathy. The NeurogenX treatment has also been effective in patients with **Chronic Regional Pain Syndrome**, Restless legs and Fibromyalgia.

This innovative treatment protocol using Combination Electrochemical Therapy (CET) has shown significant benefits in improving the quality of life in patients with peripheral neuropathy symptoms. CET suppresses axonal pain signals both electronically and chemically, decreases peripheral sensitization to break the pain cycle, suppresses edema, improves circulation and enhances the reparative process.

The safety and efficacy of CET has been established in different studies, i.e., (Odell R H, Songard R, Anti-inflammatory Effects of Electronic Signal Treatment; Pain Physician; 11:891-907).

If you have a patient with chronic lower extremity pain, peripheral neuropathy, restless legs or Fibromyalgia we would be happy to evaluate them to determine if they are a candidate for the NeurogenX treatment protocol.
